Anne visits news.com and logs in to her account. This diagram shows what can be collected along the way, depending on whether she connects to the website via http or https (shown as http:// or https:// in the browser bar).

1. This is a simplified representation. Your traffic will pass through many more pieces of infrastructure.
2. Data travels in both directions. You send a request to the website server, and it sends a response back.
3. Every device in the diagram has a unique identifying MAC address. This includes your computer.
Anne visits news.com via a secure VPN. She logs in to her account. This diagram shows what can be collected along the way, depending on whether she connects via a secure HTTPS or insecure HTTP connection.

1. This is a simplified representation. Your traffic will pass through many more pieces of infrastructure.
2. Data travels in both directions. You send a request to the website server, and it sends a response back.
3. Every device in the diagram has a unique identifying MAC address. This includes your computer.
Through his browser, John logs in to his webmail account and sends an email to Anne. This diagram shows what can be collected along the way.

1. This is a simplified representation. Your traffic will pass through many more pieces of infrastructure.
2. The diagram assumes a secure HTTPS connection between John’s computer and his webmail provider.
3. Data travels in both directions. You send a request to your email provider, and it sends a response back.
4. Every device in the diagram has a unique identifying MAC address. This includes your computer.
5. The only way to be 100% sure an email is encrypted is to do it yourself, using something like GPG.

A project by TACTICAL TECHNOLOGY COLLECTIVE
1. Each colour in the diagram represents a specific frequency band of the radio spectrum.
2. This is a simplified representation of mobile communication.
3. Your communication passes through many more pieces of infrastructure, including servers and national gateways. Each parent company also has its own ISP.
GPRS/3G/4G/LTE
Wireless mobile telecommunications technologies.

Bluetooth
Wireless technology that allows devices to connect and exchange data over short distances.

Browser fingerprint
Unique identification pattern created by the specific configuration and use of your device (language settings, browser version and type, display resolution, etc). Shared by your browser.

Browser history
List of web pages you’ve visited, usually recorded by default by your browser.

Cell Tower
Elevated structure that houses antennas and equipment that support cellular communications.

GSM (Global System for Mobile Communication)
Standard mobile telecommunications protocol that provides wireless transmission of voice calls and SMS.

HTTPS
Protocol that creates an encrypted connection between your device and a website. Shown as https:// or a small lock symbol in the browser bar, instead of the default http://.

IP (Internet Protocol) address
Unique number assigned to each device connected to a computer network or the internet, enabling it to exchange data with other devices on the network. Your IP also shows where you are connecting from.

ISP (Internet Service Provider)
Company or organisation that provides your internet connection.

MAC (Media Access Control) address
Unique number assigned to each device, enabling it to connect to, and be identified on, the network.

National Internet Gateway
Physical infrastructure through which internet traffic travels across national boundaries.

NFC (Near-Field Communication)
Protocol that enables communication between two devices over a very short distance: e.g. smartphones, or a smartphone and an NFC Reader.

Router
Device that connects and directs internet traffic (e.g. connects ‘home’ devices to the internet).

Server
Combination of computer program and device that provides specific services for other computers to access (for example hosting a website or routing traffic from one point to another).

Telco (Telecommunications Company)
Provides your connection to a telecommunications network.

Wi-Fi
Technology that enables network connectivity via radio waves (wireless), enabling devices to connect to computer networks.
